

VectorCAST

Embedded Software Testing

An Integral Part of the

EADS DO-178B

Software Development Environment

EADS Defence & Security uses VectorCAST Test Automation tools to validate software for their next-generation aircraft, the A400M. These tools are an integral part of the EADS DO-178B development environment. The RTCA DO-178B standard is one of the highest safety critical standards in the world, incorporating the most rigorous software testing and traceability requirements. The A400M will have one of the largest cargo capacities and longest ranges for aircraft in its class. Its interior also represents a significant technology leap with a full glass cockpit and fly-by-wire. The A400M will operate in many configurations including cargo transport, troop transport, MEDEVAC, aerial refueling, and electronic surveillance. Vector Software is proud to partner with EADS Defence & Security in ensuring the highest safety standards for the ground-breaking A400M.
